Nice Smart Home

1.

In the provider selection window, choose **Fibaro** to proceed the project setup based on this home automation service provider.

> See the **list of smarthome providers** in **detailed project setup**, to check which ones are supported

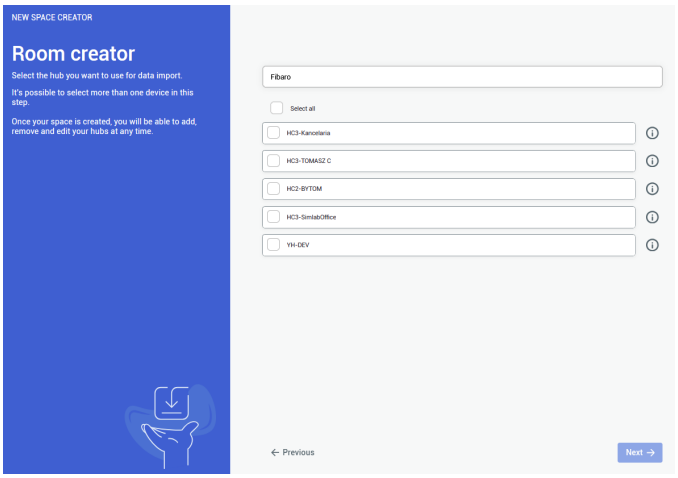

You will be redirected to **Fibaro login page**.

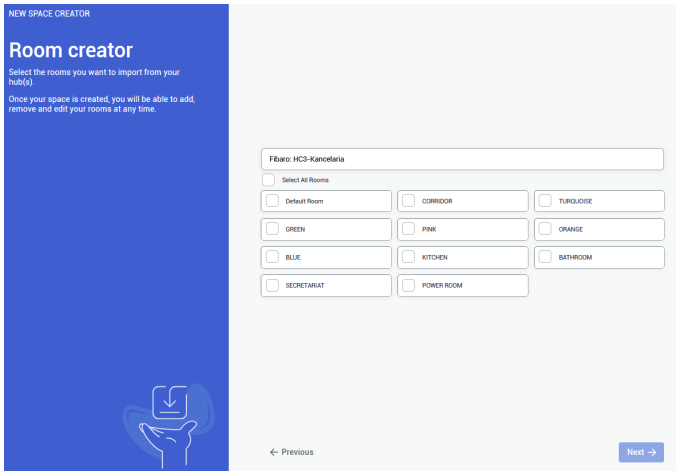

2.

After logging into your **Fibaro Account**, you will see the list of available **smarthome hubs**.

Select the appropriate one(s) and proceed.

3.

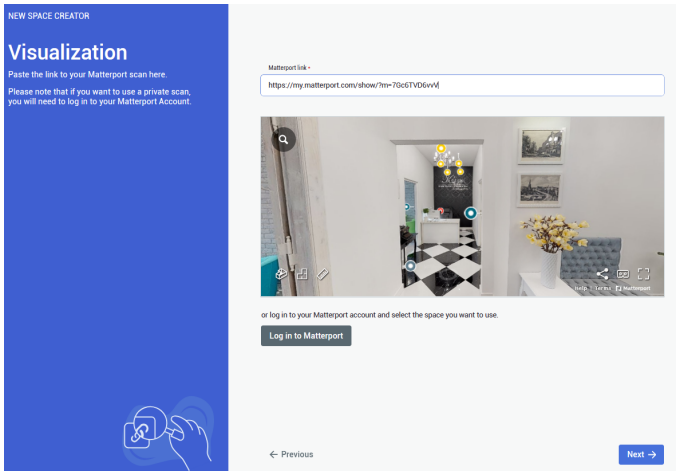

Here you can import the rooms. Pick at least a single room to be imported.

> You are not required to import all of the rooms, although it is recommended - to keep the consistency between smarthome environments

> Rooms can be added and edited afterwards as well

4.

The last step is to provide a **Matterport Virtual Tour** link. Either public o private link is accepted.

> To use **private link**, you are required to **log in** to an appropriate **Matterport Account**

Continue to project setup

> You can add a provider by selecting Providers in the side bar, and then clicking on **Add connections** button. The process will look exactly the same

> You can also delete a connection by clicking on **Remove connections** button. Devices imported from the selected hub will be also deleted
